DREAMROUTE_

Our project is called Dreamroute and it is a Flask API powered travel recommendation website. We use a nostalgic Myspace inspired layout and a cyberpunk graphic to differentiate our website from other travel websites. We present our data through three distinct recommendation panels built using Astro, React, and custom CSS. The panels are activated when a user uses the filter buttons and hits “find my destination” which queries our API and returns data points and recommendations. Some of our data points include cost, weather, local activities, vibe and a scoring based on how closely the destination matches the filters. The theme is built around disruption of the clean minimalist websites we have all become so accustomed to. Our intended audience is not standard tourists or families but more tech-oriented people who are tired of the boring and corporate feel of other travel websites. We want to invoke nostalgia of the early internet and 90s retro. Even with our more unique look we still wanted the website to feel familiar and usable, so we were inspired by pages like Booking.com, Expedia, and Kayak. From these pages we took things like the drop-down filters, the search button, and the idea for singular recommendation panels. We were directly inspired by the two images below which focus on cyberpunk and glitch art. Overall, our retro fans will certainly enjoy what we’ve done and how we don’t look like your regular travel page without compromising on usability.
